Volatility Weighting Methodology

Victory Capital, the Sub-Advisor of the ETF, combines fundamental criteria and volatility weighting in an effort to outperform traditional cap-weighted indexing strategies.

About the Index

- The universe² for the Victory US Large/Mid Cap Volatility Weighted BRI Index begins with the largest U.S. companies by market capitalization with positive earnings in the four most recent quarters.
- The Index eliminates the companies that do not satisfy the proprietary Biblically Responsible Investing ("BRI") filtering criteria.
- A volatility weighted index assigns percentage values to each security in the Index based on the volatility of that security in the market. More volatile stocks have a lower weighting, and less volatile stocks are assigned a higher weighting.
- Reconstitutes every April and October

The performance of the Fund may diverge from that of the Index.

Fund holdings and sector allocations are subject to change, may differ from the Index, and should not be considered investment advice. Standard deviation is applied to the annual rate of return of an investment to measure the investment's volatility. Investors also use it as a gauge for the amount of expected volatility. R-squared values can range from 0.00 to 1.00, with the market index at 1.00. Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. Price-to-earnings ratio (P/E ratio) is the ratio for valuing a company that measures its current share price relative to its per-share earnings.

¹**VictoryShares US 500 Volatility Wtd ETF - CFA** ("corresponding non-BRI Index") consists of 500 of the largest U.S. stocks with consistent positive earnings. These stocks are then weighted based on their standard deviation (volatility).
